- ▶ Pseudocode
- ▶ Flowchart

Abstraction

Abstraction is getting rid of the useless information that is not going to have any contribution to the solution.

Abstraction is the core concept of computer science and computational thinking. To be able to express a real world problem to a computer, the problem has to be abstract.

THE ABSTRACT-O-METER

Let's abstract stuff!

The key part of abstraction is ignoring the useless aspects of something and including the beneficial aspects. So, find out the useless aspects that are going to be ignored and the beneficial aspects that are going to be considered of the items below. Try going abstract as far as possible. (For example a house is nothing but a shelter for humans when you look abstractly)

Car

Pencil

House

Mobile phone

HINT: Think of what do these objects help solving and which aspects of them wouldn't prevent them from solving that particular problem.

Let's Abstract Stuff!

The abstractions should look something like this:

Object	Include	Ignore
Car	Engine, tires, rims, seat	Color, shape, trunk, radio
Pencil	color of the tip, grip	material, brand, type
Mobile phone	speaker, microphone, cellular	color, brand, camera

1 Pseudocode

Pseudocode

Let's discuss and try to predict what does pseudocode mean!

Pseudocode

- Pseudocodes are one of two popular ways to represent an algorithm.
- Pseudocode is an informal way of representing a computer program or an algorithm.
- It looks like a programming language though, it should be written in a programming language for it to be executed. It's language-agnostic.
- Writing pseudocode is basically writing what you want your program to do in English.
- Aims to mimic the general style of a programming language

```
OUTPUT 'What is your name?'
INPUT user inputs their name
STORE the user's input in the name variable
OUTPUT 'Hello' + name
OUTPUT 'How old are you?'
INPUT user inputs their age
STORE the user's input in the age variable
IF age >= 70 THEN
    OUTPUT 'You are aged to perfection!'
ELSE
    OUTPUT 'You are a spring chicken!'
```

Pseudocode

```
OUTPUT 'What is your name?'
INPUT user inputs their name
STORE the user's input in the name variable
OUTPUT 'Hello' + name
OUTPUT 'How old are you?'
INPUT user inputs their age
STORE the user's input in the age variable
IF age >= 70 THEN
    OUTPUT 'You are aged to perfection!'
ELSE
    OUTPUT 'You are a spring chicken!'
```

Pseudocode

```
OUTPUT 'What is your name?'  
INPUT user inputs their name  
STORE the user's input in the name variable  
OUTPUT 'Hello' + name  
OUTPUT 'How old are you?'  
INPUT user inputs their age  
STORE the user's input in the age variable  
IF age >= 70 THEN  
    OUTPUT 'You are aged to perfection!'  
ELSE  
    OUTPUT 'You are a spring chicken!'
```

Pseudocode

```
OUTPUT 'What is your name?'
INPUT user inputs their name
STORE the user's input in the name variable
OUTPUT 'Hello' + name
OUTPUT 'How old are you?'
INPUT user inputs their age
STORE the user's input in the age variable
IF age >= 70 THEN
    OUTPUT 'You are aged to perfection!'
ELSE
    OUTPUT 'You are a spring chicken!'
```

Keyword

There are these keywords that are widely used, you can use your own keywords, but these are the most frequently used amongst other computer programmers and should not be used as variable names.

START, BEGIN: This is the start of your pseudocode.
INPUT: This is data retrieved from the user through the input device.
READ, GET: This is used when reading data from a data file.
PRINT, DISPLAY, SHOW, OUTPUT: This will show your output to a screen.
COMPUTE, CALCULATE: To calculate the result of the expression.
SET, INIT: To initialize values
INCREMENT, BUMP: To increase the value of a variable
DECREMENT: To reduce the value of a variable
END: This is the end of your pseudocode

Example

Set total to zero

Set grade counter to one

While grade counter is less than or equal to ten

 Input the next grade

 Add the grade into the total

Set the class average to the total divided by ten

Print the class average.

Question

Let's write a pseudocode for calculating Mary's wage.

Inputs : hours and rate

Output: pay

Let's brew coffee

- ▶ Prepare ingredients
- ▶ Make coffee
- ▶ Prepare serving
- ▶ Enjoy

IF - ELSE IF - ELSE

This keyword is used if a certain condition has to be met for the upcoming block to be executed. For example:

IF you are happy	If you are tired
Then smile	Then rest
	else if you are stressed
	Then relax
ENDIF	else
	Keep working

As you can see we also use indentation in order to declare that “smile” is being executed **inside** the if statement above it.

IF - ELSE IF - ELSE

This keyword is used if a certain condition has to be met for the upcoming block to be executed. For example:

```
IF you are happy
    Then smile
ENDIF
```

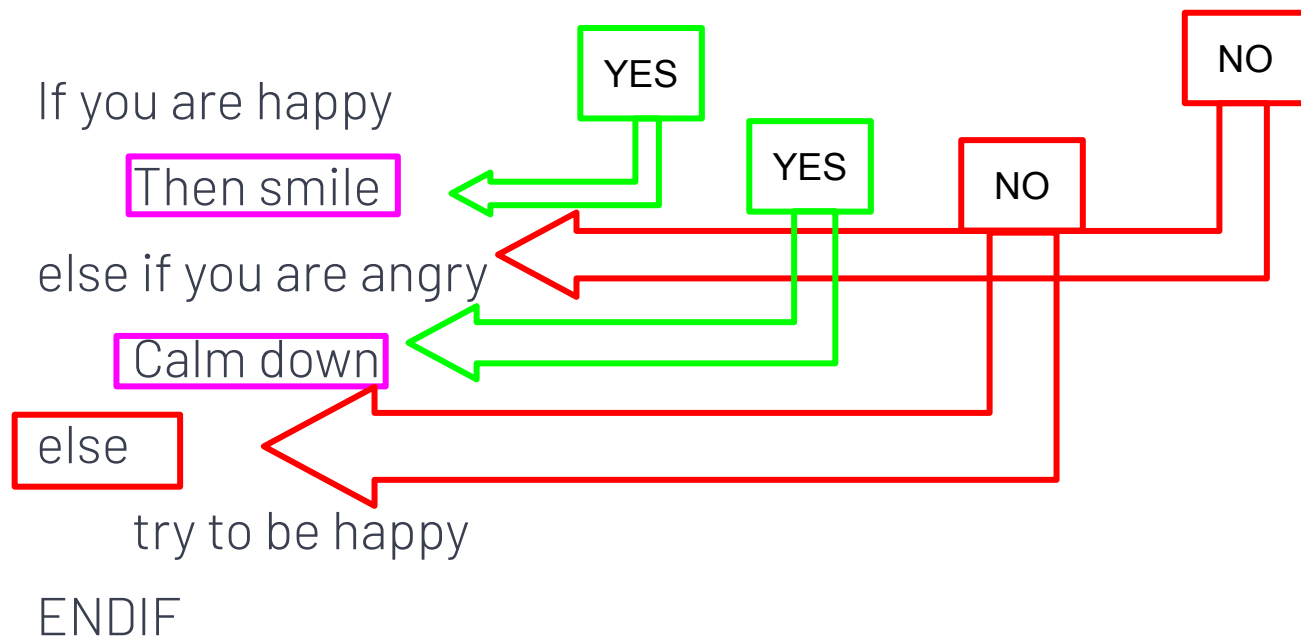

```
If you are tired
    Then rest
else if you are stressed
    Then relax
else
    Keep working
```

As you can see we also use indentation in order to declare that “smile” is being executed **inside** the if statement above it.

IF - ELSE IF - ELSE

This keyword is used if a certain condition has to be met for the upcoming block to be executed. For example:

IF - ELSE IF - ELSE

```
Begin
INPUT hours, rate
IF hours < 40
THEN
    pay = hours * rate
ELSE
    pay = 40 * rate + (hours - 40) * rate * 1.5
OUTPUT pay
End
```

FOR structure

For loop runs for each element inside a group. For example:

For every day of the week

Count;

endfor

FOR structure

For loop runs for each element inside a group.

For example:

For every 25 minutes of study

Earn one Pomodoro;

endfor

Pomodoro = Pomodoro +1

WHILE Structure

While is similar to the for loop, differently it runs the loop until the condition provided is **unsatisfied**. Example:

```
Apples = 5
```

```
Oranges = 10
```

```
While apples < oranges
```

```
    increase apples;
```

```
endwhile
```

Exercise

Write a pseudocode that takes a number as an input and prints true if it is greater than 10 and false otherwise.

Let's wash the dishes

Let's wash the dishes. Think that we have all the tools etc.

Let's wash the dishes

gather the dirty dishes

if you have a dishwasher around you

put the dirty dishes inside the dishwasher

set the settings of the dishwasher

while the time set is not over

wait

else

while dishes are not clean

take one of the dishes

wash it with your hand

dry it and put it aside

Kahoot!

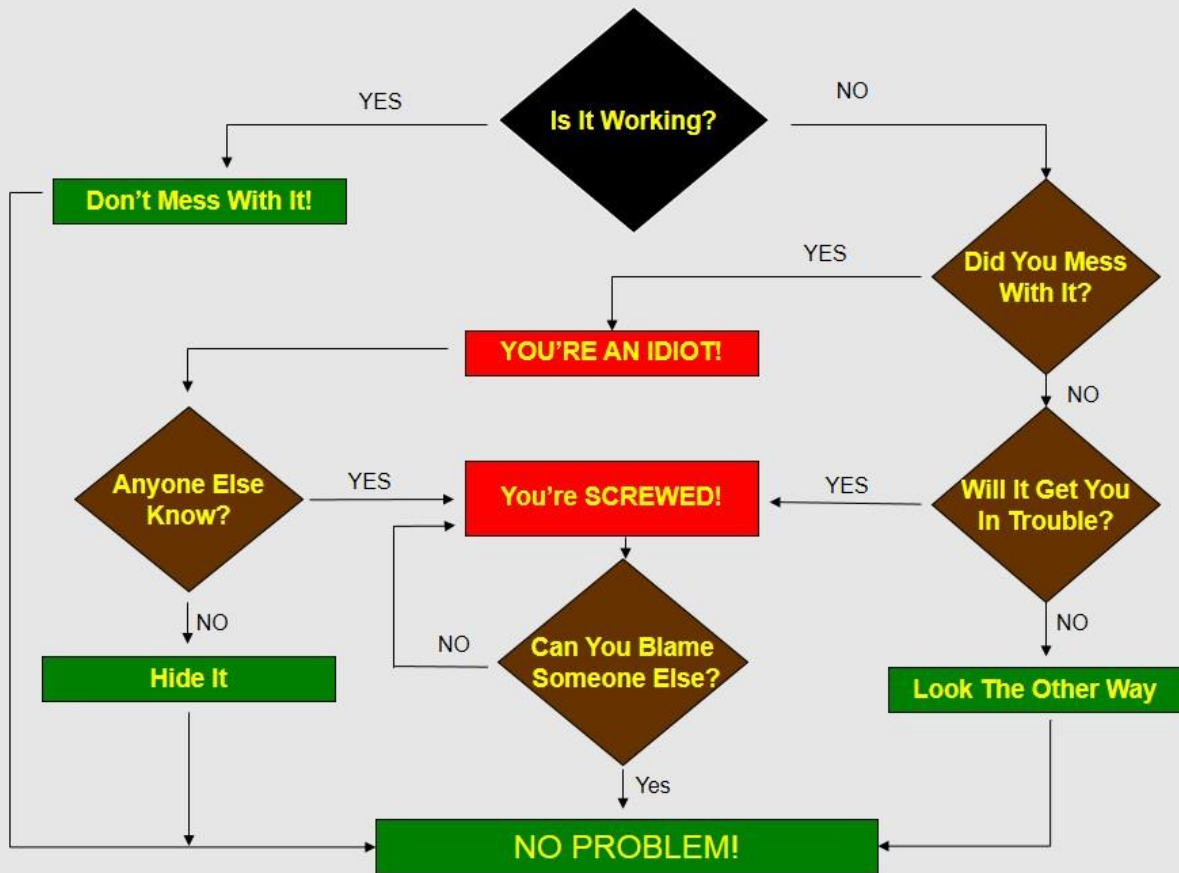

2

Flowcharts

Problem Resolution Flowchart

Flowcharts

- A flowchart is a diagram that represents a sequence of instructions.
- Flowcharts have standard symbols to represent different instructions.

Name	Symbol	Usage
Start or Stop		The beginning and end points in the sequence.
Process		An instruction or a command.
Decision		A decision, either yes or no.
Input or Output		An input is data received by a computer. An output is a signal or data sent from a computer.
Connector		A jump from one point in the sequence to another.
Direction of flow		Connects the symbols. The arrow shows the direction of flow of instructions.

Login Diagram

A flowchart to login to facebook account:

Brew Turkish Tea

Let's draw a flowchart of steps to brew Turkish tea using gitmind flowchart drawing feature!

Exercise

Bank of America has launched a promotion for its credit card customers. According to the promotion, the customers will receive a gift voucher worth \$500 with their monthly bill if they spend \$15,000 more than their last month spending and their last month bill is not less than \$10,000.

Solution

Draw the flowchart of the promotion

THANKS!
